

Introducing Wyde By Cizor

An autonomous driving learning platform

Problem

- Robotics is very expensive and hard to learn if you don't have prior knowledge.
- NASA's open source rover is \$1600, students can't afford that!

Let's take a
closer look at
Wyde

ULTRASONIC SENSOR

The image shows a custom-built robotic car. It has a white plastic chassis with two large black wheels at the front and two smaller black wheels at the back. A blue PCB with two circular ultrasonic sensors is mounted on top. A black ESP32 WROOM 3 microcontroller is also visible. Numerous colored wires connect the components. The car is set against a light blue background with a stylized grey ground and brown hills at the bottom. There are also some white star-like graphics in the top corners.

Low power firmware — if ESP resets, use a stronger 5 V supply.

★ What is Wyde?

Description

- Affordable and beginner-level rover to help first-timers learn autonomous systems.
- Made to be adapted to allow for any educational use!
- Future additions: Stronger battery and motor.

Thanks!
